

ABSTRACT OF THE DISCLOSURE

The present invention provides a service providing system capable of protecting confidential information on the users and preventing illegal use of the information. Input of ID, and password is required by a user verification device 22 as a result of performing redirect processing when a user terminal 16 try to access with a web 30 providing a pay-service. Upon entering proper ID and password, the user verification device 22 issues an access ticket. The user terminal 16 accesses the web 30 with the access ticket and receives a service therefrom. The user verification device 22 transmits information on the user to a charge-processing device 24, and the device 24 performs charge-processing. In this way, management of accessing with the web and charging a service charge(s) can be performed without disclosing confidential information such as password and so on to the administrator of service providing webs.
